分布式事务解决方案的合作与探索

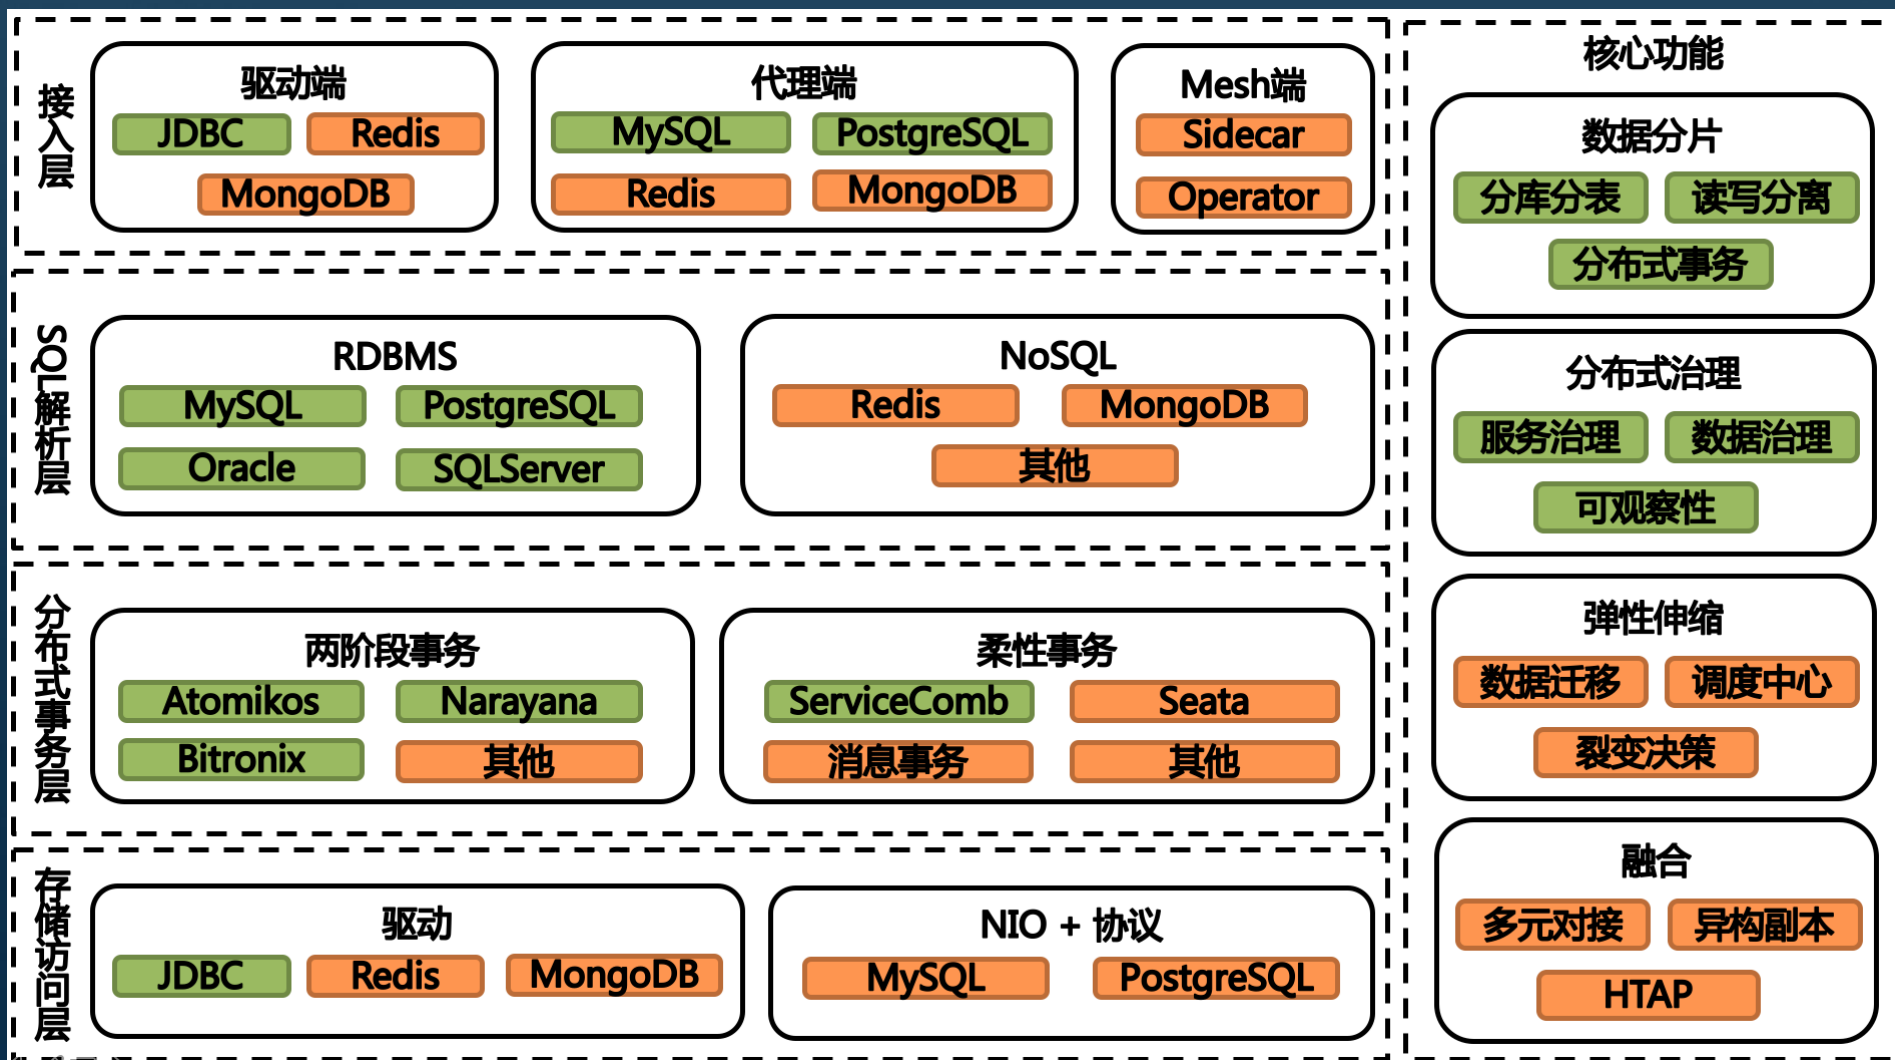

Apache ShardingSphere简介

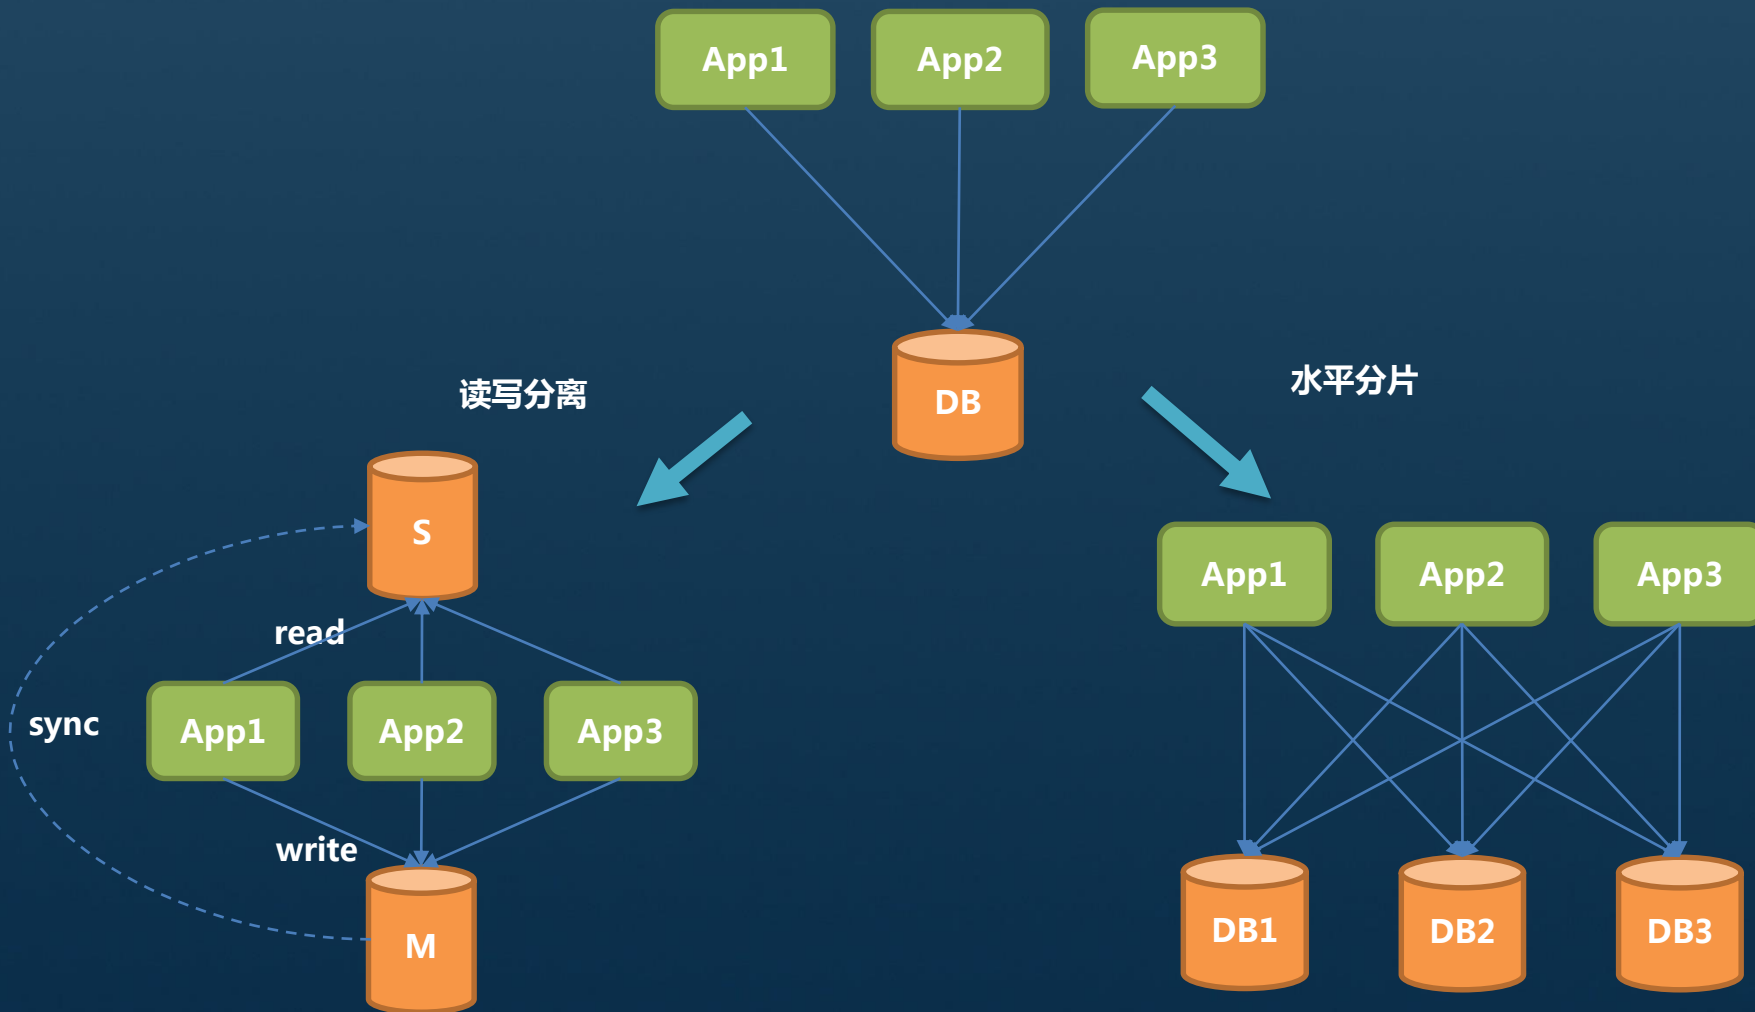

- ◆完全开源
- ◆Apache的首个分布式数据库中间件
- ◆gitHub近8000star，近百家公司的成功落地案例
- ◆核心功能：数据分片&分布式事务&数据库治理
- ◆多接入端选择
- ◆京东主导，多公司&社区参与推动

Apache ShardingSphere生态

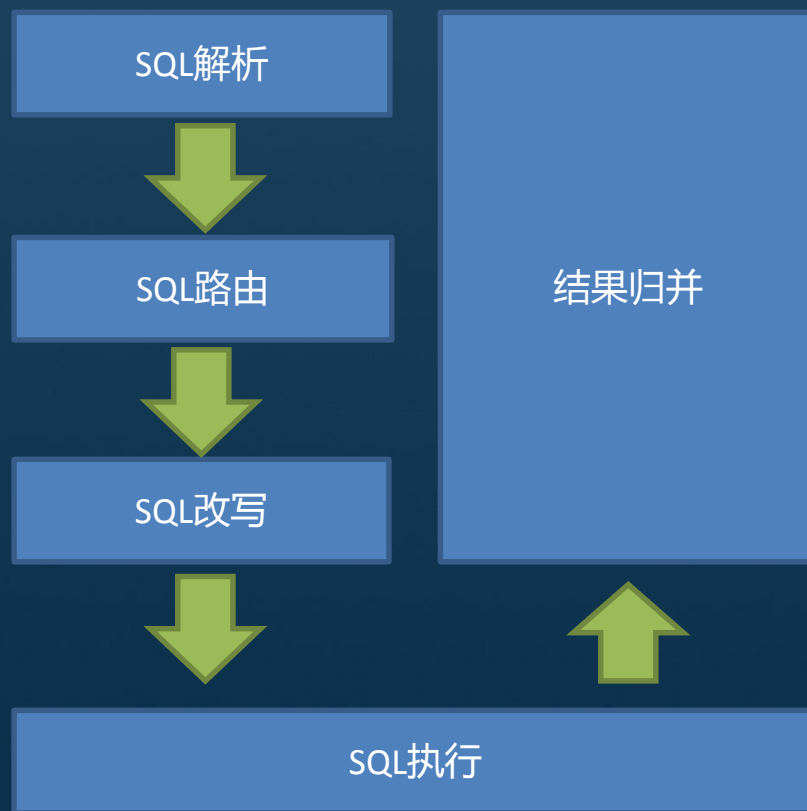

数据分片

数据分片

数据分片

分布式治理

数据治理

- 权限
- 数据脱敏
- SQL防火墙 & SQL审核

可观察性

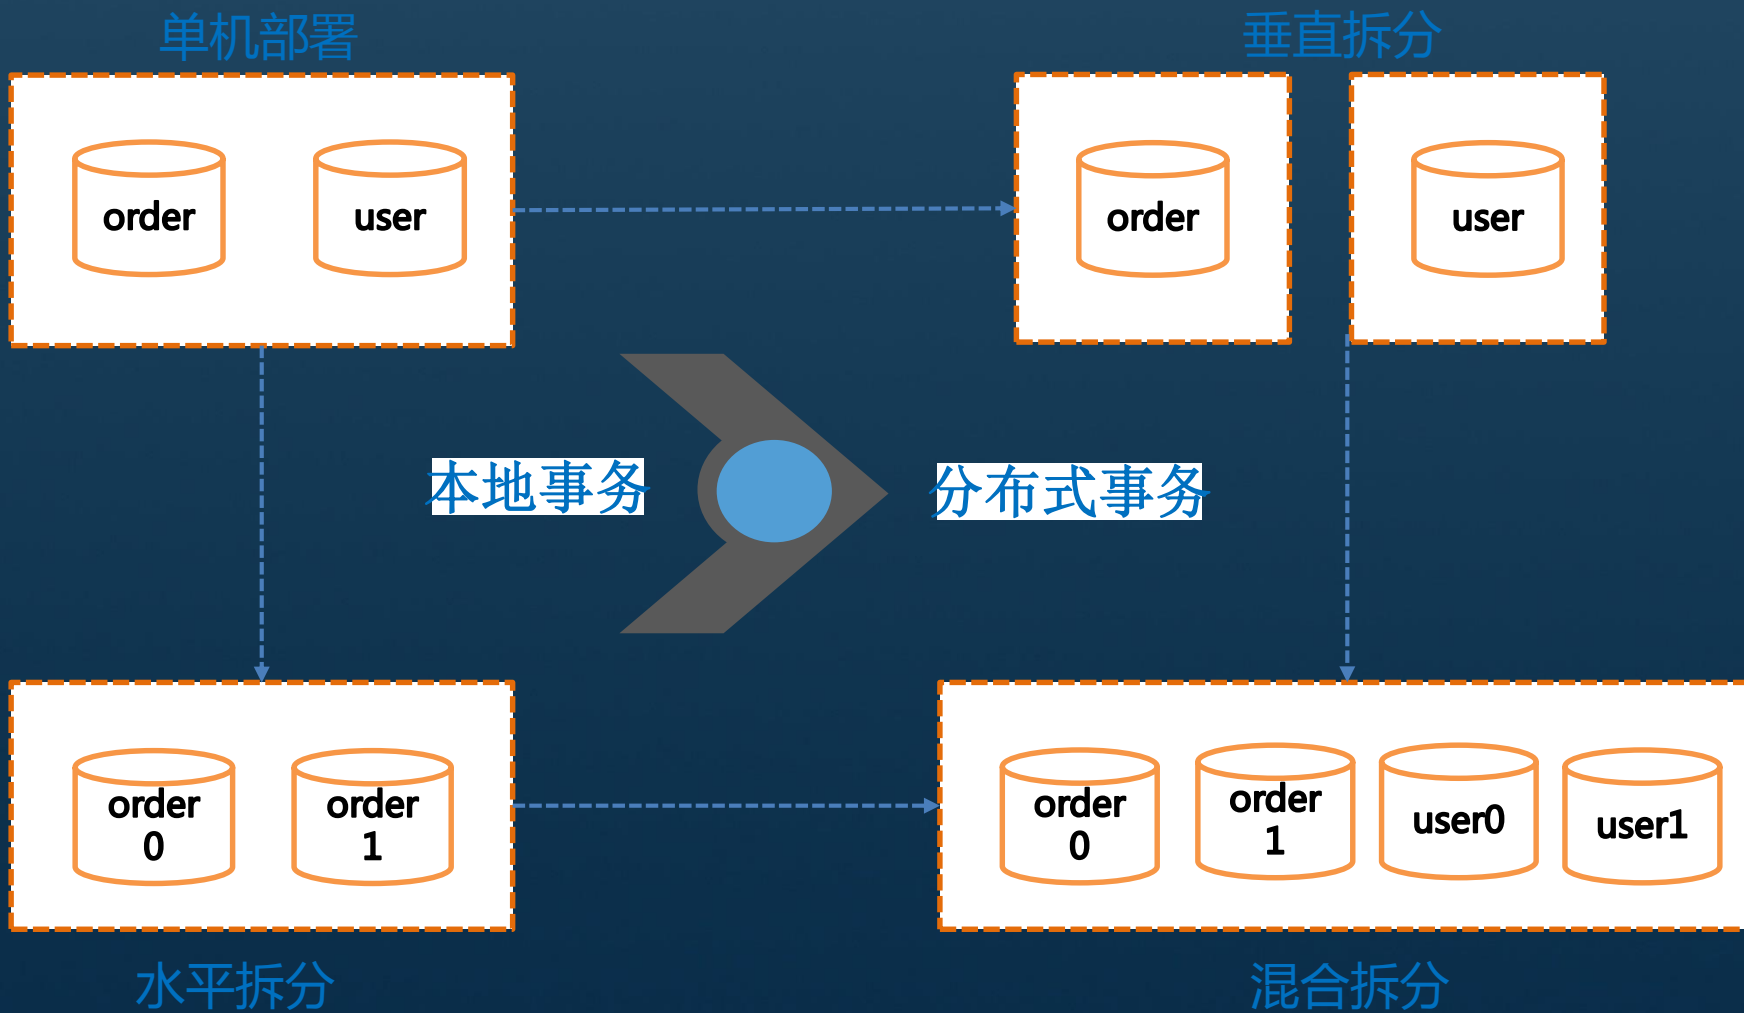

- APM
- 链路追踪
- 调用拓扑图
- 监控报警

服务治理

- 配置动态化
- 高可用
- 过载保护 & 熔断 & 禁用 & 失效转移

分布式事务的需求体现

分布式事务概述

事务对比

	本地事务	两阶段事务	柔性事务
业务改造	无	无	实现相关接口
一致性	不支持	强一致	最终一致
隔离性	不支持	原生支持	服务保证
并发性能	无影响	严重衰退	略微衰退
适合场景	业务方处理不一致	短事务/低并发	长事务/高并发
事务层级	数据库层	数据库层	服务层

Saga概述

◆论文出处：<https://www.cs.cornell.edu/andru/cs711/2002fa/reading/sagas.pdf>

◆一个长事务可以拆分成相对独立的若干子事务

$$LLT = T_1 + T_2 + \dots + T_j + \dots + T_n (j < n)$$

◆除了最后一个子事务外，每个子事务都对应着一个补偿子事务

$$T_1 + T_2 + \dots + T_j + \dots + T_n$$

$$C_1 + C_2 + \dots + C_j + \dots + C_{n-1} (j < n - 1 < n)$$

◆SAVEPOINT用于持久化各个子任务的执行状态

◆补偿行为：Forward Recovery/Backward Recovery/混合

◆执行路径

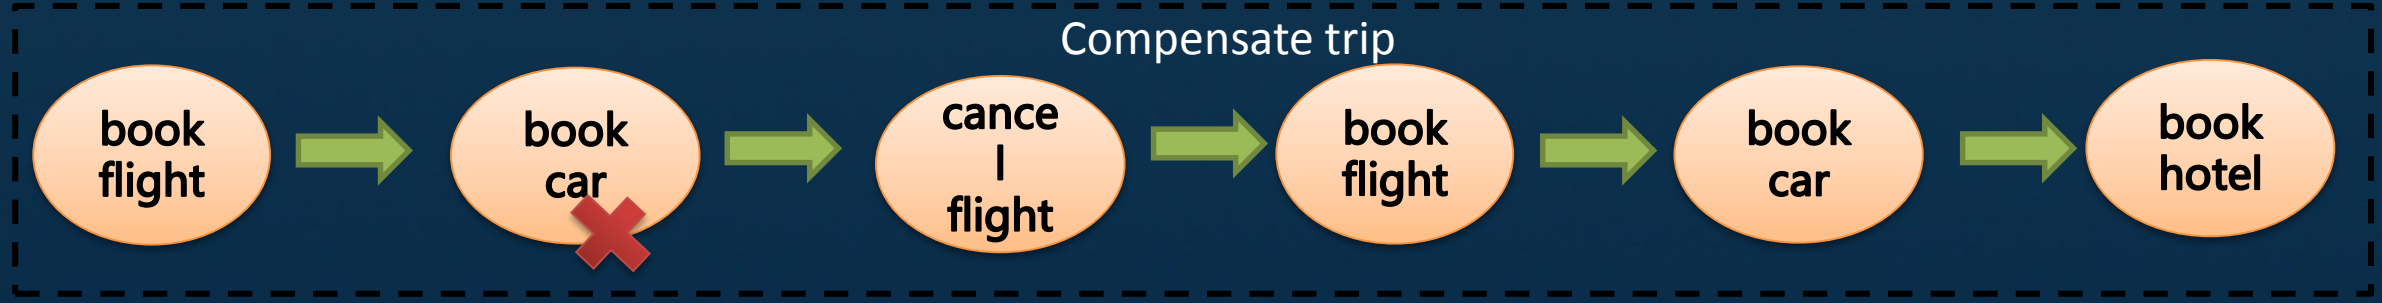

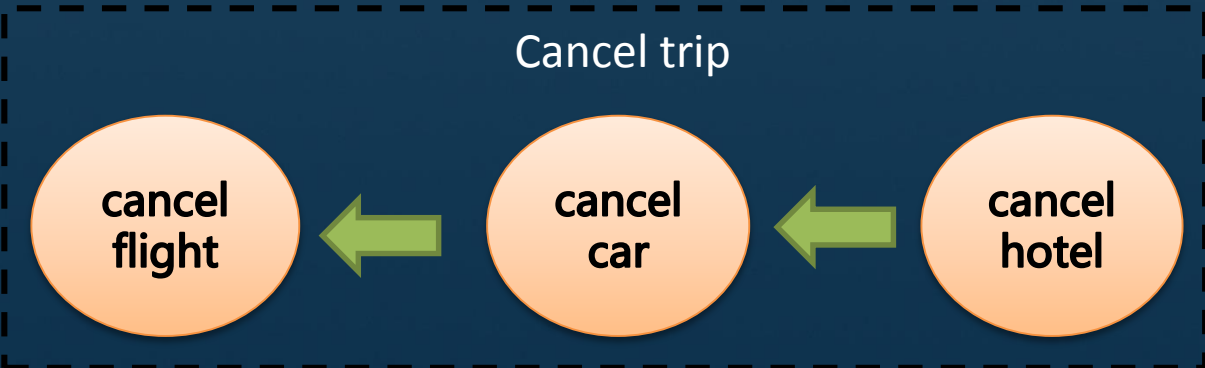

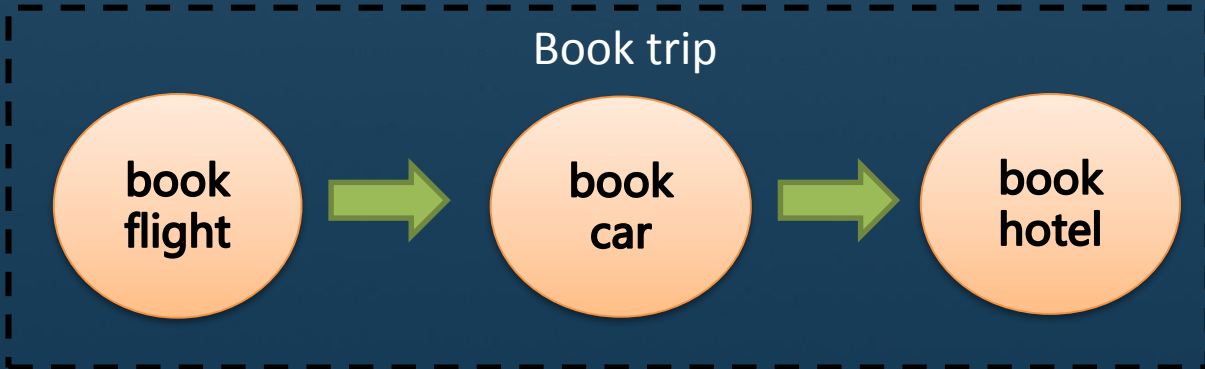

$$T_1 + T_2 + \dots + T_j + \dots + T_n (j < n)$$

$$T_1 + T_2 + \dots + T_j + C_j + C_{j-1} \dots + C_1 (j < n)$$

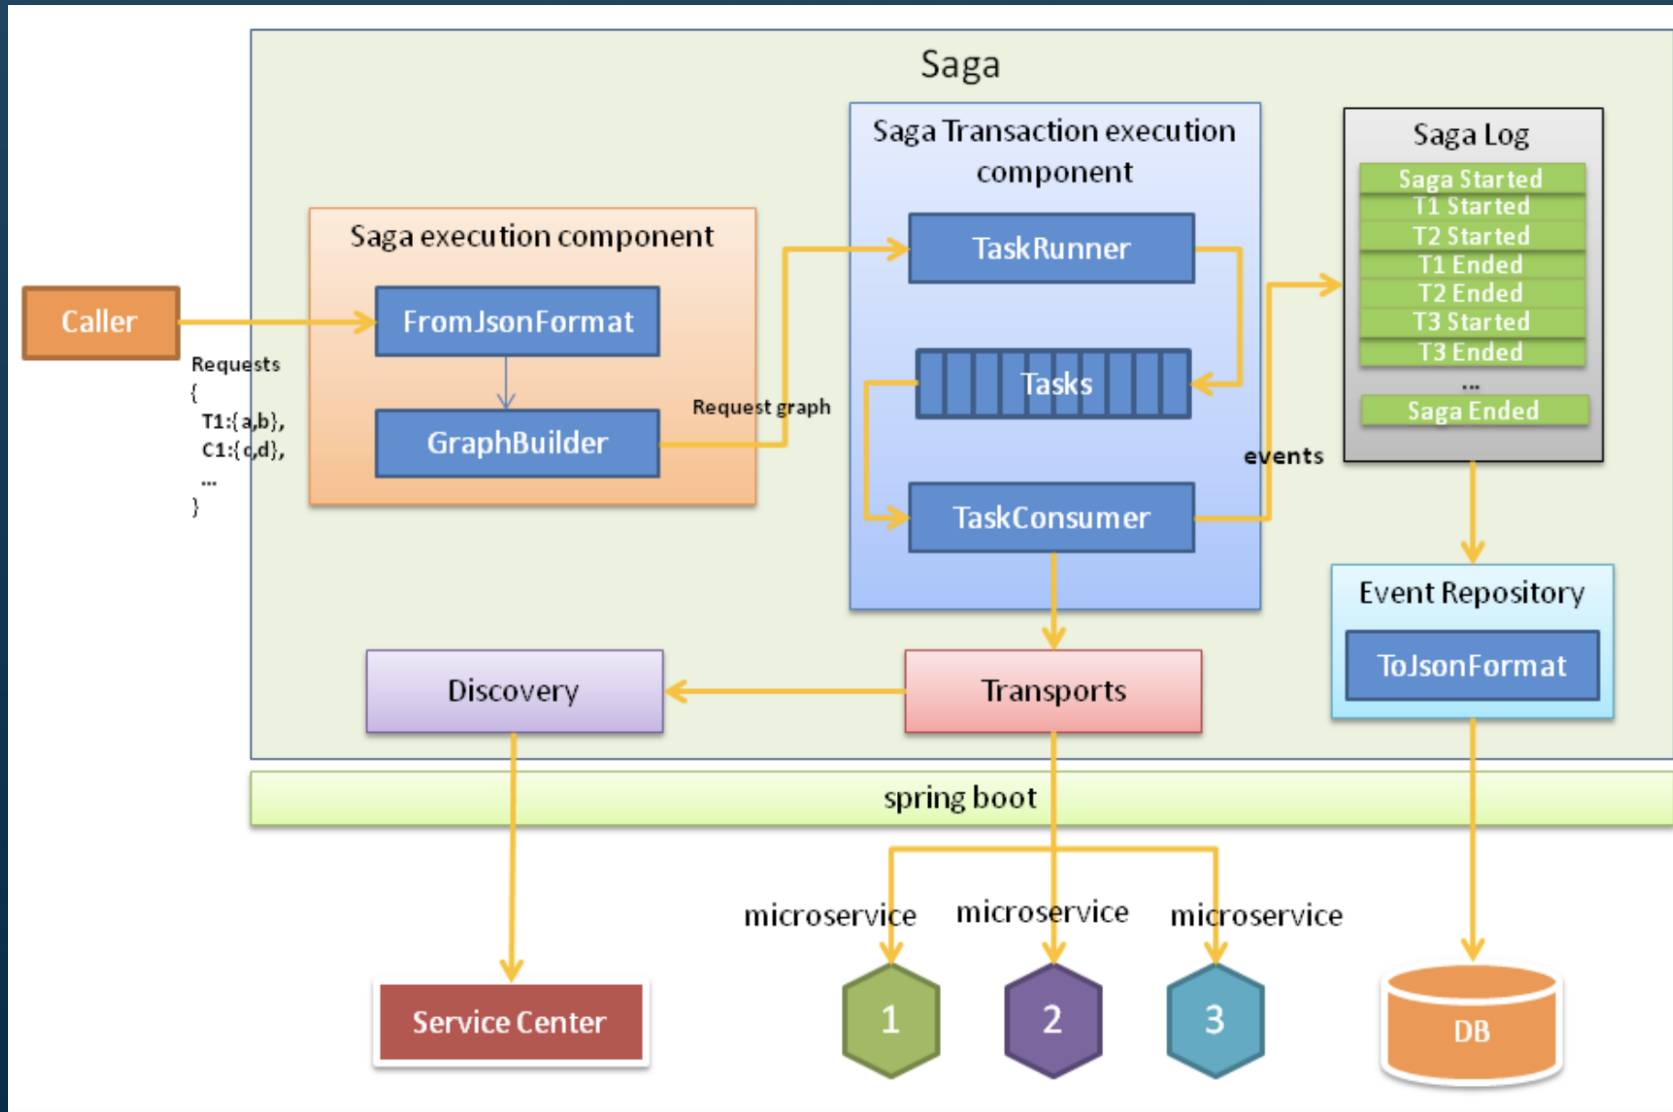

$$T_1 + T_2 + \dots + T_j + C_{j-1} + T_{j-1} + T_j \dots + T_n (j < n)$$

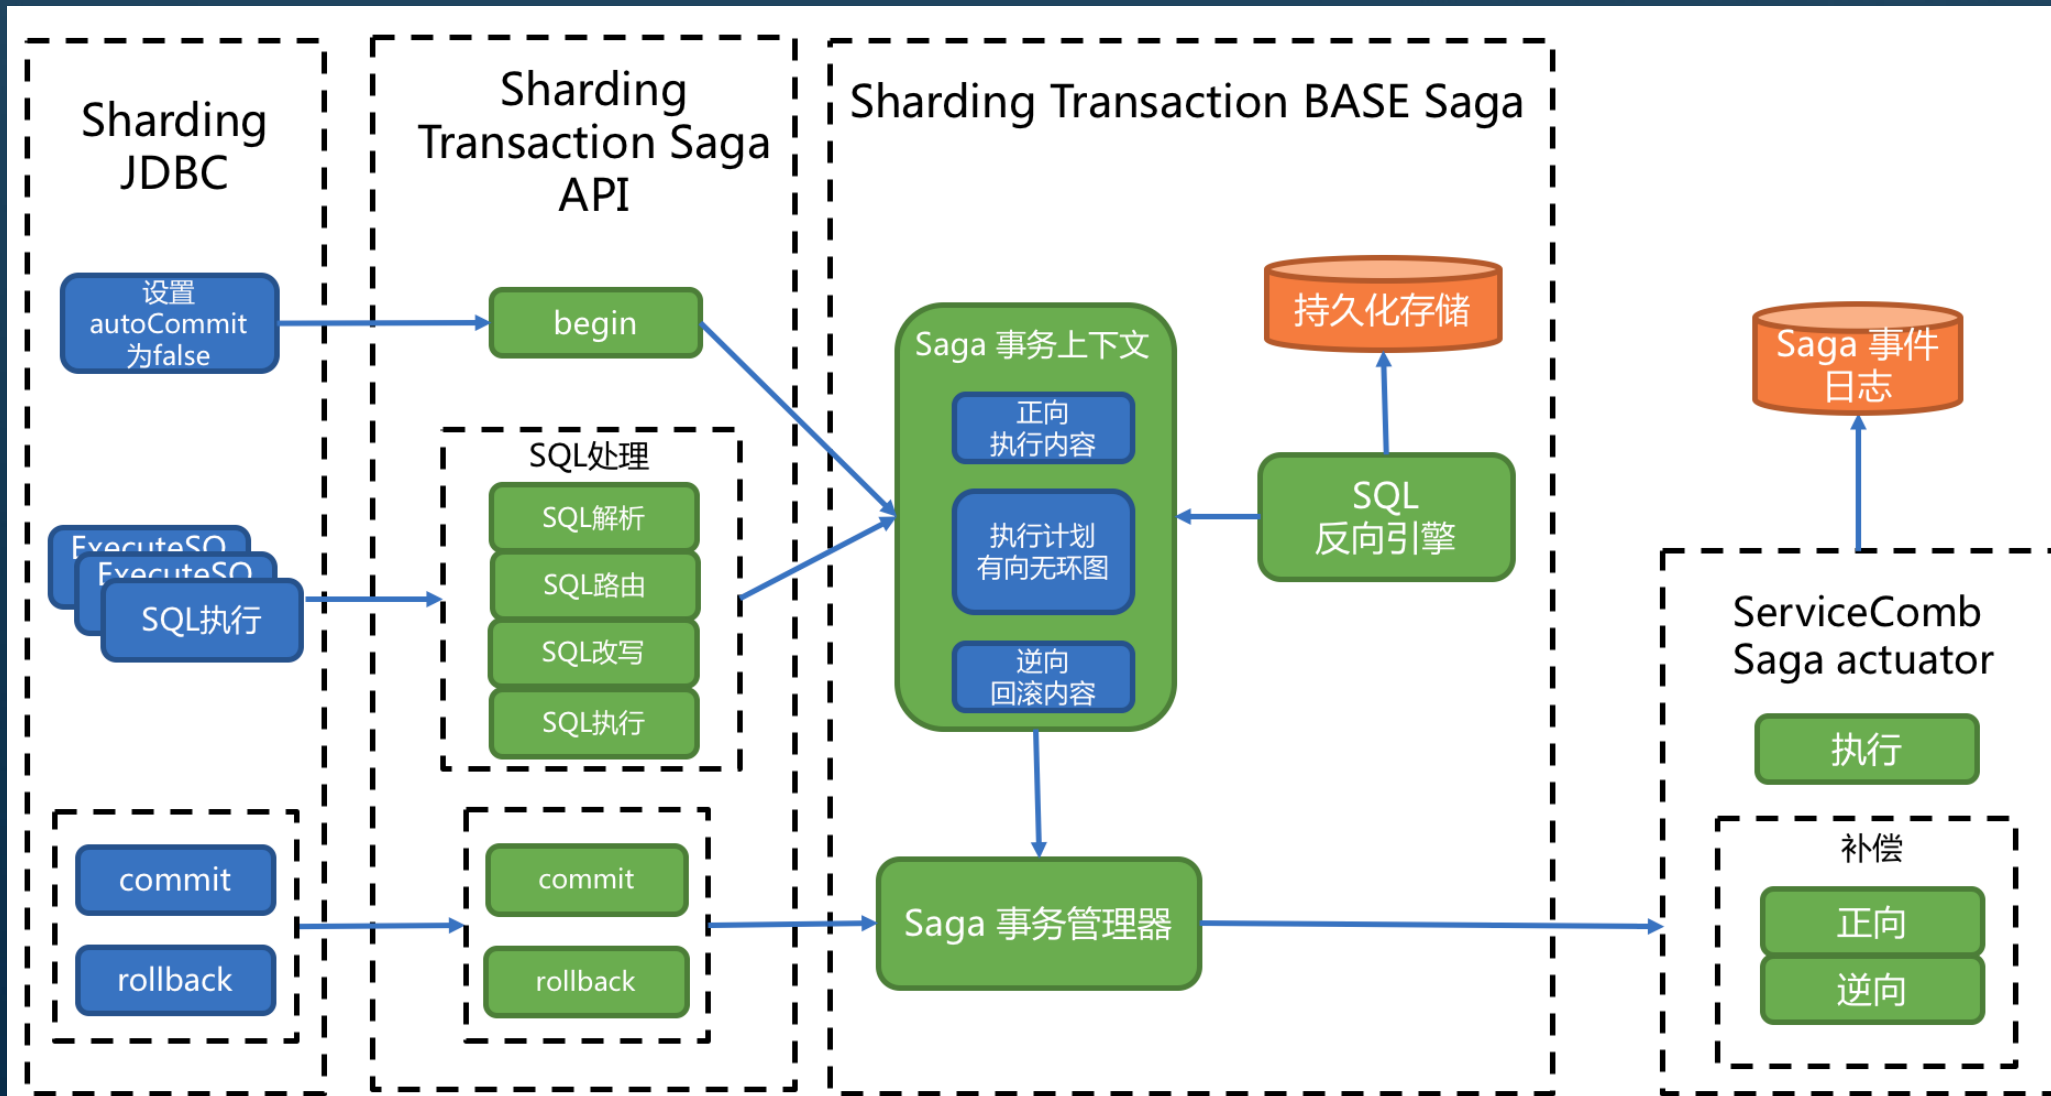

Saga概述

ServiceComb-saga

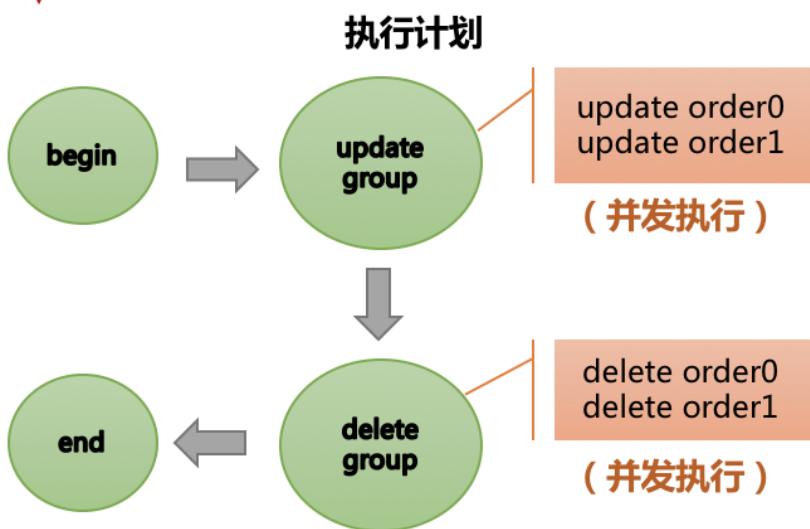

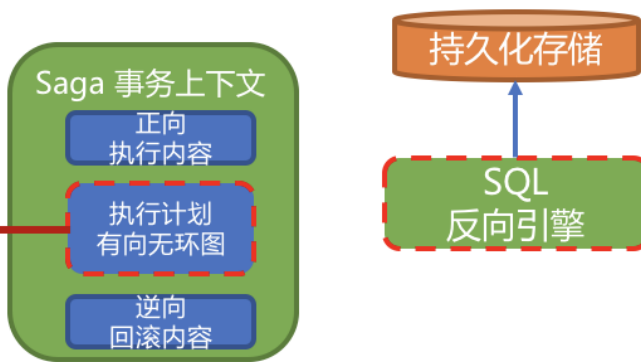

分布式事务解决方案

分布式事务解决方案

Sharding Transaction BASE Saga

原始操作

```
Begin;  
UPDATE order SET status = 1 WHERE id = 10;  
DELETE FROM order where id = 20;  
Commit;
```

正向执行内容

```
Begin;  
UPDATE order0 SET status = 1 WHERE id = 10;  
UPDATE order1 SET status = 1 WHERE id = 10;  
DELETE FROM order0 where id = 20;  
DELETE FROM order1 where id = 20;  
Commit;
```

逆向执行内容

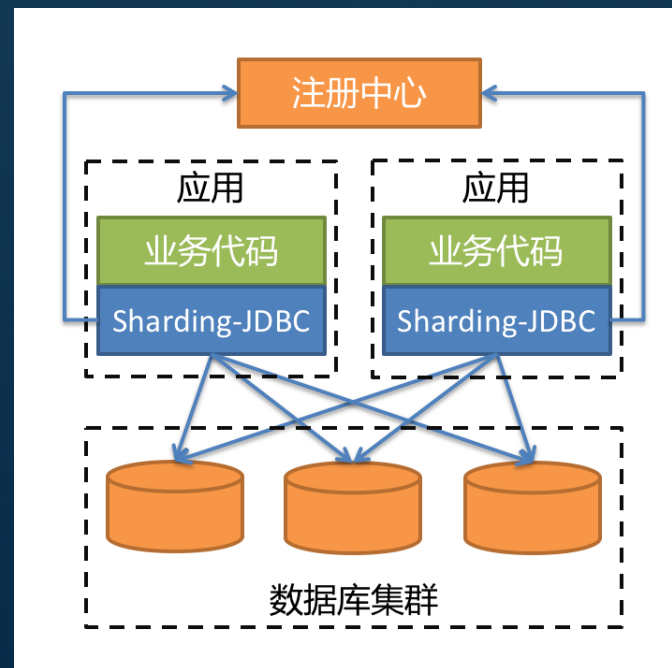

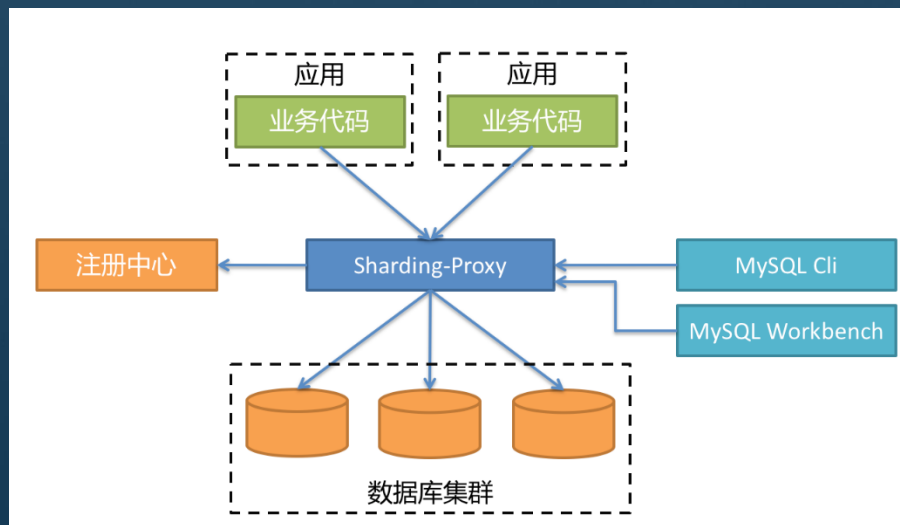

```
Begin;  
UPDATE order0 SET status = 0 WHERE id = 10;  
UPDATE order1 SET status = 0 WHERE id = 10;  
INSERT INTO order0(id, name, status) VALUES (20, 'A', 0);  
INSERT INTO order1(id, name, status) VALUES (20, 'A', 0);  
Commit;
```

接入端选择

	JDBC	Proxy
数据库	任意	单一
连接数	高	低
异构语言	仅Java	任意
性能	损耗低	损耗略高
无中心化	是	否
静态入口	无	有
